

Evolution and Religion... or religion and religion?

Misunderstood critters- Dinosaurs

It is interesting to know that most dinosaur bones are found in only **9 places on earth**. If we erased these places from the world map, they would hardly be noticed. Most of the bones are found in very large water-laid dinosaur graveyards. To say that these critters dominated the earth is at the very least an imagination stretch.

It is interesting to know that many of the critters we see and hear about are not terrible lizards (dinosaurs). They are warm-blooded animals. All one has to do is check out any book about dinosaurs, or listen carefully to presentations about dinosaurs.

There is a logical reason for the size of some dinosaurs. But, one has to go to the Bible for that reason.

Let's consider another issue that we seldom hear about. How did the plants evolve independently at just the right time to support the enormous appetites of the dinosaurs. It **might** be reasonable to say animals have some intelligence and evolved because of their need to survive, but what about the plants. The plants have no intelligence to know of their danger and need for survival. *Can you imagine a daisy being concerned about survival?*

And then we have the disgusting problem of the huge amounts of dinosaur dung that had to be dealt with. Now we have all the insects, microbes, etc. that had to evolve at just the right time...with just the right job description. Again, we could go on and on down this path. It sounds like it would take **more faith** to believe in evolution than to believe in creation. It sure sounds like we are discussing **religion** and religion instead of **evolution** and religion.
