

The Scientific Law of Biogenesis

There has never been one case in recorded scientific research where life was created from inorganic material.

We have heard a lot about life being formed in a test tube. If we consider protein (formed from existing organic material) life, the rumors are true. To say protein is life is stretching the issue a bit. Protein is a building block of life. But, the Law of Biogenesis is still true...organic matter is matter existing in or derived from living organisms.

In contrast, the theory of evolution claims first-life came from inorganic material. Almost every book written to support the theory of evolution gives a list of necessary ingredients for the formation of first-life. All of them include organic material.

The theory of evolution does not attempt to explain the source of first-life. It just claims it! Believing that life comes from no-life is a matter of extreme evolutionary faith that goes against scientific law.

To believe life was created on earth by a living, caring, intelligent designer is a matter of faith verified through the scientific law of Biogenesis...life comes from a living God.

Believing in an intelligence that is capable of creating the wonders of our universe helps us understand God's invisible qualities— His eternal power and divine nature.
