

The Reality of Color!

Color is governed by strict law. If we put red and blue together, we always get some shade of purple...never green.

The theory of evolution implies everything evolved because of need. But, color has no life of its own and has no needs. If evolution is real, what is the need for color in the rainbow? Where is the need for deep sea animals that live in total darkness?

The theory of evolution is simple. All animal life evolved from a brainless, tiny, one-celled critter...with no eyes,

Was there another first-life for plants who display remarkable color. Neither of these first-lives could see colors. Why did plants fail to develop eyes to take advantage of color? Or did color evolve after the first-life critters. If these

first-life had no need for color, when did they decide to grow eyes?

How did the same color system evolve independently in animals, plants and dirt...exactly the same way? How did the different animals learn to tell the difference between all the colors?

We could just say it happened by chance! But, where is the honesty in just ignoring the facts?

Which idea make more sense—color just happened by chance, or God provided color as an important part of his creation. Color is not just something for critters to use. It is the source of inspiration and beauty for God's greatest creation...man. We see the qualities of the invisible God— His eternal power and divine nature. (Romans 1:20)
