

What is movement? What causes movement? How did it evolve? Without movement (coming together) matter could not exist.

It is believed this combining was caused by water, but what caused the first molecules to move so that hydrogen and oxygen could combine to form water? How did the molecules come together? What caused water to move after it was formed?

Complex natural laws like gravity, heating, cooling, pressure, magnetism, electrical impulses, etc. determine movement. How do we explain the complete phenomena of planet, hurricane, tornado, volcano, tidal and animal movement. We have a impossible situation here. Without movement nothing could come together, but we have to have first-movement for the forces of movement to work.

If this sounds like double-talk...you are right. Trying to explain how the world came together without a designer is an endless search for answers that do not exist.

Creation simply claims movement was part of the fabulous world...created by a fabulous, intelligent God.

Which theory offers the reasonable explanation of movement?
