

In the evolutionary scheme, early-life did not have the ability to change its surrounding and could not make sound. So, everything needed for sound had to be available before sound could become part of our world. Before sound could be used by early-life, some form of ear would have to appear to detect the vibration of sound or the actual sound of sound. Which came first...sound, or the ability to hear?

If first-life was surviving without sound, what would be the advantage of hearing. It would seem to be confusing, frightening and even deadly. Some animals cannot survive without the sense of sound, so when did sound become necessary?

Even if we could somehow understand the development of the need for sound in one animal, how do we explain the ability to hear in all the different kinds of animals... independently? How do we explain the sound sensations that fill our world that have nothing to do with animals?

Sound is very complex! It can be harnessed to provide moving music, explosive power and soothing comfort. We know how it works, but its effect defies explanation.

The only explanation that can be offered by those who support the theory of evolution is random chance.

In creation, sound is the expression of the beauty, comfort, passion, power and calmness found in the heart of the creator.

# The Excellence of Sound!

Which concept makes sense!
